

SensNet

The largest cause of sensory impairments is the ageing process with over 60s. Rising life expectancy and increasing numbers of older people in the population in Europe means a growing number of individuals are affected by visual and hearing impairments. Thus, raising general awareness of problems and potential solutions is essential to maximising individual quality of life and minimising social isolation.

The key challenge related to the quality of life of older people with sensory impairments is the training and the skills of professionals working in care services addressed for this specific target group.
